ebba70a Add default favicon to layout icons
Insert a default '/favicon.ico' entry into the icons array in app/[locale]/layout.tsx so there is a fallback favicon alongside the light/dark color-scheme-specific icons. This ensures browsers that don't honor the media queries (or older agents) still get a favicon.

c4b8fee Make AsciiLightning responsive and textured
Prevent horizontal overflow and improve scaling for the AsciiLightning component: add max-width and overflow rules to the hero and bolt styles and switch font-size to a viewport-based min() calculation. Replace the simple '*' template with a richer ASCII art using multiple texture characters, introduce TEXTURE_CHARS, update TEXTURE_COUNT to count those chars, and render the original texture characters (with opacity) instead of a fixed block glyph. These changes allow finer-grained textures and avoid clipping on small viewports.

5c6676a

Add cookie consent banner and gtag support

Introduce a CookieBanner component with styles and translations (en/pt) to let users accept or decline cookies. Wire the banner into the locale layout and initialize gtag consent defaults to denied. Persist choice in localStorage and call gtag('consent','update',...) when granting consent. Add TypeScript gtag window types for safer usage.

027d256

Add AI mentions to English & Portuguese copy

Introduce references to AI tools and AI-augmented workflows across site copy in web-app/messages/en.json and web-app/messages/pt.json. Updated meta descriptions, hero and services text, service bullets (added AI-augmented workflow items), development deliverables (AI-assisted code review), values (AI as multiplier), infra/tooling lists, campaign/copy sections and badges to mention Claude, Cursor, Copilot (and related tools). These changes clarify that AI tools are used to speed writing, review and testing while keeping human judgment and architecture intact.

7e18acf

Refactor AsciiBlock rendering and styles

Replace the old '*' texture template with a larger ASCII art map and use actual shimmer characters (@, #) instead of forced 1ch texture cells. Adjust CSS: reduce monospace font-size and remove the .textureCell rule, keep overflow handling; also add overflow:hidden to .heroBlock. Update shimmer logic: compute TEXTURE_COUNT from new chars, slightly tweak opacities, shorten per-line animation delay, and simplify density initialization (SSR-safe deterministic start). Overall this makes the AsciiBlock use the original characters for rendering, refines visual density/animation, and cleans up related styles.

7828e7d

Add fast-delivery campaign page, FAQ & UI

Add a new fast-delivery campaign page with styles and content (page.tsx + page.module.css), including stats, phases, benefits, CTAs and FAQ. Introduce CampaignFAQ (client accordion) and AsciiLightning (animated ASCII art) UI components with CSS, plus Typewriter usage on contact/CTA areas. Update contact page and footer to display HQ address and a fast-delivery nav link, and add address styles. Expand/enhance en/pt translations with campaign copy, location strings and change timing language from weeks→days. Also add local .claude commands for running Next/TypeScript.

21/04, 01:54

98a73f4

Move favicon.ico to public directory

20/04, 19:19

Remove top-level web-app/middleware.ts and add a new middleware at web-app/src/proxy.ts using next-intl/routing with a refined matcher to better ignore API, _next, assets and file-extension requests. Add a passthrough root layout at web-app/src/app/layout.tsx required by the Next.js App Router (locale-specific layouts supply the HTML). Also update the 404 page color in web-app/src/app/not-found.tsx from #408efd to #6B994C.

18/04, 15:38

0dd3220

Add theme favicons and update OG preview image

Add light and dark favicons (whiteFavicon.ico, darkFavicon.ico) and a social preview image (assets/preview_image.png). Update layout to serve theme-aware favicons using media queries and update metadata to use the new preview image for Open Graph and Twitter cards (replacing /og-default.png).

18/04, 15:08

4531140

Use next/image, update image config and middleware

Replace a native with Next.js Image in the about page and add the Image import. Update next.config to serve modern image formats (AVIF and WebP) instead of using unoptimized images. Adjust middleware matcher to exclude _next and assets so static and Next.js asset routes bypass the middleware. These changes enable Next.js image optimization and prevent middleware from intercepting static asset requests.

17/04, 19:27

b1352ae

Update page.tsx

17/04, 19:21

7192942

Disable Next.js image optimization

Update web-app/next.config.ts to replace image formats and remotePatterns with unoptimized: true. This disables Next.js built-in image optimization, simplifying image handling for environments or deployment targets that don't support Next's image optimization service or when using an external CDN.

a966489

Use base domain in from address and handle errors

Construct the email from-address using the base domain (hostname.split('.').slice(-2).join('.') to avoid including subdomains. Capture the response error from resend.emails.send, log it, and return { ok: false, error: error.message } when present. Keeps existing try/catch for unexpected exceptions.

17/04, 19:05

7470018

fixing the secret CONTACT_EMAIL leak in code

17/04, 18:49

8ee6311

Add member avatar image & update team translations

Replace initials-based member avatars with a logo image and update related styles and translations. Adds web-app/public/assets/logo_quadrado.png and uses next/image in the about page; adjusts CSS to add overflow:hidden on avatar and a .memberAvatarImg rule with object-fit:cover. Update English and Portuguese

messages: rename "Concreto Code" to "Concreto Studio" and revise tech lists (remove tRPC/Supabase, use Serverless/Postgres; replace Vercel/Sentry with Netlify/VPS).

17/04, 18:04

86fb751 fix PPNeueBit font not loading properly

17/04, 17:14

399f5b2 Add Netlify config and plugin

Add netlify.toml and .gitignore to configure Netlify builds for the web-app. Add @netlify/plugin-nextjs to devDependencies in package.json. Remove output: 'standalone' from next.config.ts to align Next.js config with the Netlify Next.js plugin and prepare the project for Netlify deployment (build base set to web-app, publish .next, functions in netlify/functions, NODE_VERSION=22).

17/04, 17:07

9f32bc4 Add Next.js web-app scaffold and docs

Add a full Next.js (App Router) web-app scaffold and supporting documentation. Includes project config (next.config.ts, tsconfig.json, package.json), i18n support, middleware, fonts, global styles, SEO/structured-data helpers, robots and sitemap endpoints, and a broad set of UI components, layout pieces, pages (about, contact, services, work, process) and modular CSS. Also add .github guidance (nextjs best-practices) and skill/reference docs for PowerShell and UI/UX design (including browser and CSS references), an implementation plan, README, AGENTS/CLAUDE notes, and other tooling files to bootstrap development.

f0701c1 perf eliminate redundant Supabase queries and R2 listings

- Catalog pages called app_settings twice per request (generateMetadata + page body); React.cache() in lib/queries.ts deduplicates to 1
- /catalogo/[id] also fetched products twice; getProduct() cache fixes it
- Dashboard waterfall: settings → inventory queries now run in parallel
- Product edit page: accessories + product fetched sequentially; now parallel via Promise.all
- checkStorageAvailable double-called calculateBucketUsage on storage full error; refactored to return { available, status } from one call
- Storage status cached in Redis (60s TTL); invalidated on file delete

22/04, 01:02

70c36a9 fix(catalogo)

fix(catalogo): replace next/script with plain script tags for JSON-LD
next/script with strategy="beforeInteractive" is unsupported outside

layouts in App Router. React 19 warns on inline script tags rendered in components. Plain
